

Maestro Aviation Limited has developed a Weight and Balance program which takes into account all the factors necessary to provide an operator with a fast and accurate Centre of Gravity calculation. This product is available immediately and is currently in use in a number of corporate jets and helicopters. It displays the CG graphically and can provide a print out for retention at the departure point or can send the data directly to flight operations using Internet technology. The system allows the departure staff to select seats for particularly over-weight passengers to ensure that a dangerous CG position does not arise. Last minute changes to the Weight and Balance can be handled quickly and easily. The captain can then sign the load sheet electronically confident that the CG is within safe limits at all stages of the flight. Maestro Aviation can provide the committee with a PC based demonstration system if required. For further information please look at our web site on :-
